

DURABLE. COOLED. SAFEGUARDED.

FROM VAULT TO VALUE: DCS LAUNCHES HIGH-SECURITY COOLER UPGRADE

DCS is proud to unveil the transformation of our former CII space vault into a cutting-edge, high-security cooler. This significant infrastructure upgrade reinforces our commitment to innovation, safety, and operational excellence. Built to meet the evolving needs of our clients, this newly repurposed space merges next-generation functionality with the trusted foundation of a secure vault.

What makes this transformation unique is its origin—the cooler is built within a former controlled substance vault, inherently designed for maximum protection. This secure foundation, paired with enhanced external surveillance, ensures both safety and efficiency. By relocating all security systems to the exterior, DCS has optimized the interior for seamless operations and increased capacity, now able to support 1800 more pallet spaces.

"This transformation merges the best of both worlds—unmatched protection and modern functionality," said Jesse Walters, Executive Vice President at DCS. The newly developed cooler is designed to support a wide range of secure storage. As the cold chain market continues to grow, this space represents a key step forward in our mission to deliver client-driven, future-ready solutions.
